

1     **Double Patenting**

2             Claims 1-14, 16-25 are provisionally rejected under the judicially created doctrine  
3 of obviousness-type double patenting as being unpatentable over claims 1-24 of  
4 copending Application No. 09/074,681.

5  
6             Applicant respectfully traverses this provisional rejection. The instant application  
7 and copending Application No. 09/074,681 were both filed on May 8, 1998. Moreover,  
8 the claims of the instant application and copending Application No. 09/074,681 do not  
9 claim common subject matter and are patentably distinct. The claims of the instant  
10 application are directed in part to the ability to transfer and store a created playlist into  
11 nonvolatile storage resident on the actual A/V device, whereas the claims of copending  
12 Application No. 09/074,681 are directed to a method of creating and automatically the  
13 custom playlist. The claims of the copending application do not teach transferring the  
14 custom playlist to an A/V device or saving the custom playlist to a non-volatile memory  
15 of the A/V device.

16  
17     **Claim Rejections – 35 USC §103**

18             Claims 1-14 and 16-25 are rejected under 35 U.S.C. 103(a) as being  
19 unpatentable over Douma et al. in view of Montoya et al. Applicant respectfully  
20 traverses this rejection of the claims.

21  
22             Applicant has carefully reviewed the Examiner's remarks on pages 6-8 of the  
23 August 2, 2001 office action and wishes to offer the following reply. While the  
24 arguments put forth in the office action address some of the issues raised by Applicant,  
25 they fail to address other important arguments put forth by Applicant and to look at the  
26 claims as a whole. A significant problem that Applicant still sees with the rejection over  
27 Douma et al. in view of Montoya et al. is that while Douma teaches that a remote  
28 computer can generate a playlist, the reference does not teach or suggest that the  
29 playlist is transmitted to any A/V system and stored on an A/V system. Rather, Douma  
30 transmits command instructions or codes only; this is not the same as transmitting the

1 playlist. Moreover, the command instructions are transmitted to an intelligent A/V  
2 receiver, not an actual A/V device. This approach is quite different from Applicant's and  
3 has its drawbacks. If the link is broken, tracks cannot be played, since control of the  
4 A/V device is performed remotely. Similarly, if power is lost, all the information is lost as  
5 well. This problem is overcome in the present invention by transferring the actual  
6 playlist (and not just command codes) to the actual A/V device; the present invention  
7 does not require the use of an expensive, redundant intelligent A/V receiver and thus  
8 can simply transfer and receive data over a simple link.

9  
10 Even if one were to combine Douma et al. with Montoya et al., this shortcoming  
11 of the references is not overcome. Montoya et al. is cited as a reference teaching how  
12 a playlist can be generated. It does not teach or suggest transmitting a playlist to a  
13 remote A/V device or storing it directly on the A/V device as required in the claims.

14  
15 In light of the foregoing facts, Applicant must respectfully reassert the  
16 patentability of the claims of the instant application over the combination of Douma et  
17 al. and Montoya et al. The arguments put forth by the response of August 2, 2001 do  
18 not overcome these shortcomings. The Examiner argues that the PC of Douma et al.  
19 surely has a nonvolatile memory. While this may be the case, the generated playlist will  
20 not be stored in a NVM of a PC since, according to Douma, the playlist itself is never  
21 transferred! Only the command codes or instructions are transferred and these are  
22 transmitted to an intelligent A/V receiver, not an A/V device. The Examiner further  
23 argues that Applicant made the argument that Montoya and Douma do not detail a  
24 "virtual CD." Applicant must take the opportunity to point out that the term "virtual CD"  
25 was not used in the remarks put forth in Applicant's June 20, 2001 response and so this  
26 characterization is not accurate. Additionally, whether Montoya or Douma et al. teach  
27 that a playlist is modifiable, they nonetheless fail to teach, suggest, disclose, or  
28 otherwise obviate that an entire playlist, after being created, is then transferred for  
29 storage to the actual A/V device itself.

1 In light of the foregoing remarks, Applicant again takes the opportunity to  
2 reiterate the shortcomings of the Douma and Montoya references below. This  
3 discussion was presented previously, but serves to underscore and provide support for  
4 the foregoing remarks that are aimed at moving prosecution of this application forward  
5 in a meaningful way.  
6

7 Applicant respectfully submits that the Douma and Montoya references, whether  
8 considered together or singly, do not teach aspects of the present invention. The  
9 Douma reference describes a "remote control" system for multimedia systems.  
10 Commonly, remote controls are handheld devices which communicate with multimedia  
11 devices via a wireless (infrared) link. Typically, they only work when the user is in the  
12 same room as the multimedia device. The Douma reference describes a remote  
13 control system in which the handheld device is replaced by a computer and the wireless  
14 link is replaced by the Internet. This enables a multimedia device to be controlled  
15 remotely from any location. Further, Douma describes an intelligent A/V receiver (10)  
16 which allows multiple devices to be connected to the same Internet node. The  
17 operation of the Douma system is summarized in his Figure 2. Steps 206, 208, 210,  
18 212, 214 all describe a process for sending commands to control a multimedia  
19 component.  
20

21 In contrast, the present invention is not concerned with remote control of a  
22 plurality of A/V devices. All control is performed locally on the A/V device itself, or via a  
23 separate remote control. The present invention allows playlist data stored in a non-  
24 volatile memory in the A/V device to be updated via a link. Once the memory is  
25 updated, the link is no longer required. The control of the A/V device (play, stop,  
26 volume, etc) is not performed by the external device. This control is performed via  
27 controls on the A/V device itself or through use of a remote control device (page 6 lines  
28 10-13 of the specification).  
29

1           The remote computer described in the Douma reference may be used to  
2 generate a playlist, but the playlist is not transmitted to any of the A/V systems nor is it  
3 stored on the A/V device. Douma (col 2 lines 54-61 et seq) describes the transfer of  
4 information to an intelligent A/V receiver. However, this information consists of control  
5 instructions (commands). No playlist is transferred. Further, the information is only  
6 transferred to the intelligent A/V receiver, not to the A/V devices themselves. If the link  
7 is broken, the tracks cannot be played, since control of the A/V device is performed  
8 remotely. Further, all information will be lost when power is shut-off. The A/V devices  
9 do not contain non-volatile memory. In contrast, they contain code to operate control  
10 switches (142 in Fig 5).

11  
12           The system of Douma requires use of an intelligent A/V receiver, configured as  
13 an Internet node. The present invention does not use an intelligent A/V receiver. The  
14 A/V device of the present invention needs only to receive or transmit data over a simple  
15 link, such as an RS232 link. The A/V device does not act as an Internet node. The  
16 method of the present invention avoids the (significant) cost of an intelligent A/V  
17 receiver.

18  
19           Montoya also describes the generation of a playlist. However, Montoya does not  
20 disclose transferring the playlist to a remote A/V device, nor does he disclose storing  
21 the playlist in a memory on a remote A/V device. Since neither Montoya nor Douma  
22 disclose these steps, even if one were to combine the Douma and Montoya references,  
23 the result would not be the claimed invention. The result would also not suggest or in  
24 any way render obvious the claimed invention. The specification (page 2, lines 12-22)  
25 recognizes that creating a custom playlist on an A/V device is known. However, the  
26 inclusion of a graphical user interface into a consumer A/V device, as might be  
27 suggested by the Montoya reference is prohibitively expensive, and teaches away from  
28 the present invention. The present invention recognizes that an expensive graphical  
29 user interface is not required, since the same functionality may be achieved by using a  
30 PC, or other external device, which the user might already own. In this way, the

1 benefits of a graphical user interface are achieved without the large additional cost of a  
2 built-in graphical user interface.

3  
4 Applicant has previously amended independent claim 1 to better claim these  
5 distinctions between the present invention and the Douma and Montoya references,  
6 whether considered separately or together. Claims 2-14 and 16-25 depend from claim  
7 1. Applicant believes that the foregoing remarks overcome the rejection of the claims  
8 over the Douma and Montoya reference, whether considered singly or together.  
9 Reconsideration and allowance of these claims are therefore respectfully requested at  
10 the Examiner's earliest convenience.

11  
12 The Examiner's continued work on this application is appreciated. If there are  
13 any questions, the Examiner is cordially invited to contact the undersigned.

14  
15 Respectfully submitted,

16
